Contech Research

An Independent Test and Research Laboratory

CERTIFICATION

This is to certify that the LSHM series connector evaluation described herein was designed and executed by personnel of Contech Research, Inc. It was performed with the concurrence of Samtec, Inc. of New Albany, IN who was the test sponsor.

All equipment and measuring instruments used during testing were calibrated and traceable to NIST according to ISO 10012-1, ANSI/NCSL Z540-1 and MIL-STD-45662 as applicable.

All data, raw and summarized, analysis and conclusions presented herein are the property of the test sponsor. No copy of this report, except in full, shall be forwarded to any agency, customer, etc., without the written approval of the test sponsor and Contech Research.

ALICE HATHAWAY
PROJECT ENGINEER
CONTECH RESEARCH, INC.

APH:ld

SCOPE

To perform qualification testing on the LSHM series connector as manufactured and submitted by the test sponsor, Samtec, Inc.

APPLICABLE DOCUMENTS

1. Unless otherwise specified, the following documents of issue in effect at the time of testing performed form a part of this report to the extent as specified herein. The requirements of sub-tier specifications and/or standards apply only when specifically referenced in this report.
2. Samtec Test Plan: TC0929-2611 (LSHM) Test Plan
3. Standards: EIA Publication 364

TEST SAMPLES AND PREPARATION

1. The following test samples were submitted by the test sponsor, Samtec, Inc., for the evaluation to be performed by Contech Research, Inc.

<u>Description</u>	<u>Part Number</u>
a) Connector (large board)	LSHM-150-06.0-L-DV-A-N
b) Mate (small board)	LSHM-150-06.0-L-DV-A-N

2. Test samples were supplied assembled and terminated to test boards by the test sponsor. Specific test boards were supplied for the following tests:
 - LLCR, IR and DWV
 - Shock & Vibration, nanosecond event detection
3. Test leads were attached to the appropriate measurement areas of the test samples and applicable mating elements.
4. The test samples were tested in their 'as received' condition.
5. Unless otherwise specified in the test procedures used, no further preparation was used.
6. The mated test samples were secured via a stabilizing medium to maintain mechanical stability during testing, as noted in the specific test procedures.

TEST SELECTION

1. See Test Plan Flow Diagram, Figure #1, for test sequences used.
2. Test set ups and/or procedures which are standard or common are not detailed or documented herein provided they are certified as being performed in accordance with the applicable (industry or military) test methods, standards and/or drawings as specified in the detail specification.

SAMPLE CODING

1. All samples were coded. Mated test samples remained with each other throughout the test group/sequences for which they were designated. Coding was performed in a manner which remained legible for the test duration.
2. The test samples were coded in the following manner:

Seq A: Group A1 - A-A1-1, A-A1-2
Group A2 - A-A2-1, A-A2-2
Group A3 - A-A3-1, A-A3-2
Group B - A-B1-S2, A-B1-S3

Seq B: Group A1 - B-A-1, B-A-2, B-A-3, B-A-4, B-A-5,
B-A-6, B-A-7, B-A-8

Seq C: Group A - C-A-1, C-A-2, C-A-3, C-A-4, C-A-5,
C-A-6, C-A-7, C-A-8

Seq D: Group A - D-A-1, D-A-2, D-A-3

TEST RESULTS

SEQUENCE A

Group B

PROJECT NO.: 209422

SPECIFICATION: TC0929-2611

PART NO.: LSHM-150-06.0-L-
DV-A-N

PART DESCRIPTION: LSHM series
connector

SAMPLE SIZE: 2 Samples

TECHNICIAN: BE

START DATE: 8/26/09

COMPLETE DATE: 8/26/09

ROOM AMBIENT: 22°C

RELATIVE HUMIDITY: 48%

EQUIPMENT ID#: 321, 466, 1457

INSULATION RESISTANCE (IR)

PURPOSE:

To determine the resistance of insulation materials to leakage of current through or on the surface of these materials when a DC potential is applied.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 21.
2. Test Conditions:
 - a) Between Adjacent Contacts : Yes
 - b) Mated Condition : Mated and Unmated
 - c) Mounting Condition : Mounted
 - d) Electrification Time : 2.0 Minutes
 - e) Test Voltage : 500 VDC
3. The test voltage was applied to specific test points on the test boards.

REQUIREMENTS:

When the specified test voltage is applied, the insulation resistance shall not be less than 5,000 megohms.

RESULTS: See Next Page.

RESULTS:

1. All test samples as tested met the requirements as specified.
2. Actual initial Insulation Resistance values:

<u>TEST SAMPLE</u>	<u>RESULTS</u>
IR, MATED PAIR, PART S2	>50,000 MEGOHMS
IR, MATED PAIR, PART S3	17,000 MEGOHMS
IR, MATED PAIR, MATE S2	>50,000 MEGOHMS
IR, MATED PAIR, MATE S3	>50,000 MEGOHMS
IR, UNMATED, PART S2	>50,000 MEGOHMS
IR, UNMATED, PART S3	>50,000 MEGOHMS
IR, UNMATED, MATE S2	>50,000 MEGOHMS

DIELECTRIC WITHSTANDING VOLTAGE (SEA LEVEL)

PURPOSE:

1. To determine if the connector can operate at its rated voltage and withstand momentary overpotentials due to switching, surges and other similar phenomenon.
2. To determine if the connectors maintain their dielectric integrity after being stressed by exposure to environmental conditioning.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 20.
2. Test Conditions:
 - a) Between Adjacent Contacts : Yes
 - b) Mated Condition : Mated and Unmated
 - c) Mounting Condition : Mounted
 - d) Hold Time : 60 Seconds
 - e) Rate of Application : 500 volts/sec.
 - f) Test Voltage : 75% of Breakdown Voltage
 - g) Applied Voltage : 675 VAC
3. To determine the Applied Voltage as listed above, AC voltage was applied to the specified test points until breakdown. The Applied Voltage used was 75% of the minimum breakdown voltage as tested. The test samples were tested mated (Sequence a Group A1), and each LSHM connector part and mate was tested unmated (Sequence a Groups A2, A3) to determine the minimum breakdown voltage.

-continued on next page.

PROCEDURE:-continued

4. The voltage was applied to specific test points on each board.

REQUIREMENTS:

When the specified test voltage is applied, there shall be no evidence of breakdown, arcing, etc.

RESULTS:

All test samples as tested met the requirements as specified.

THERMAL SHOCK

PURPOSE:

To determine the resistance of a given electrical connector to exposure at extremes of high and low temperatures and the shock of alternate exposures to these extremes, simulating the worst probable conditions of storage, transportation and application.

PROCEDURE:

1. The test environment was performed in accordance with EIA 364, Test Procedure 32, Method A, Test Condition I.
2. Test Conditions:
 - a) Number of Cycles : 100 Cycles
 - b) Hot Extreme : +85°C +3°C/-0°C
 - c) Cold Extreme : -55°C +0°C/-3°C
 - d) Time at Temperature : 30 Minutes
 - e) Mating Conditions : Unmated
 - f) Mounting Conditions : Mounted
 - g) Transfer Time : Instantaneous
3. The total number of cycles was performed continuously.
4. All subsequent variable testing was performed in accordance with the procedures as previously indicated.
5. Prior to performing variable measurements, the test samples were allowed to recover to room ambient conditions.

REQUIREMENTS: See Next Page.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples as tested.
2. The insulation resistance shall not be less than 5,000 megohms.
3. When a 675 VAC test voltage is applied, there shall be no evidence of arcing, breakdown, etc.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. The insulation resistance exceeded 5,000 megohms.
3. Post Thermal Shock Insulation resistance values:

IR, MATED PAIR, PART S2 >50,000 MEGOHMS
IR, MATED PAIR, PART S3 >50,000 MEGOHMS
IR, MATED PAIR, MATE S2 >50,000 MEGOHMS
IR, MATED PAIR, MATE S3 >50,000 MEGOHMS
IR, UNMATED, PART S2 >50,000 MEGOHMS
IR, UNMATED, PART S3 >50,000 MEGOHMS
IR, UNMATED, MATE S2 >50,000 MEGOHMS
IR, UNMATED, MATE S3 >50,000 MEGOHMS
4. There was no evidence of arcing, breakdown, etc., when a 675 VAC voltage was applied.

HUMIDITY (THERMAL CYCLING)

PURPOSE:

The purpose of this test is to permit evaluation of the properties of materials used in connectors as they are influenced or deteriorated by the effects of high humidity and heat conditions. Measurements made under high humidity conditions may reflect the peculiar conditions under which the readings were made, and should be compared only to initial readings when careful analysis indicates that such a comparison is valid and applicable.

PROCEDURE:

1. The test environment was performed in accordance with EIA 364, Test Procedure 31, Test Condition B, Method III (omitting steps 7a and 7b).
2. Test Conditions:
 - a) Preconditioning (24 hours) : 50°C ± 5°C
 - b) Relative Humidity : 90% to 98%
 - c) Temperature Conditions : 25°C to 65°C
 - d) Cold Cycle : No
 - e) Polarizing Voltage : No
 - f) Mating Conditions : Unmated
 - g) Mounting Conditions : Mounted
 - h) Duration : 240 hours
3. Prior to performing variable measurements, the test samples were allowed to recover to room ambient conditions.

-continued on next page

PROCEDURE:-continued

4. All subsequent variable testing was performed in accordance with the procedures as previously indicated.
5. The voltage was applied to specific test points on the board.

REQUIREMENTS:

1. There shall be no evidence of physical deterioration of the test samples as tested.
2. The insulation resistance shall not be less than 5,000 megohms.
3. There shall be no evidence of arcing or breakdown when a 675 VAC test voltage is applied.

RESULTS:

1. The test samples as tested showed no evidence of physical deterioration.
2. The insulation resistance exceeded 5000 megohms after an air dry of 2 hours.
3. Post Cyclic Humidity Insulation Resistance values:

IR, MATED PAIR, PART S2	25,000 MEGOHMS
IR, MATED PAIR, PART S3	25,000 MEGOHMS
IR, MATED PAIR, MATE S2	15,000 MEGOHMS
IR, MATED PAIR, MATE S3	50,000 MEGOHMS
IR, UNMATED, PART S2	>50,000 MEGOHMS
IR, UNMATED, PART S3	>50,000 MEGOHMS
IR, UNMATED, MATE S2	>50,000 MEGOHMS
IR, UNMATED, MATE S3	>50,000 MEGOHMS

4. There was no evidence of breakdown, arcing, etc., when a 675 VAC test voltage was applied.

LOW LEVEL CIRCUIT RESISTANCE (LLCR)

PURPOSE:

1. To evaluate contact resistance characteristics of the contact systems under conditions where applied voltages and currents do not alter the physical contact interface and will detect oxides and films which degrade electrical stability. It is also sensitive to and may detect the presence of fretting corrosion induced by mechanical or thermal environments as well as any significant loss of contact pressure.
2. This attribute was monitored after each preconditioning and/or test exposure in order to determine said stability of the contact systems as they progress through the applicable test sequences.
3. The electrical stability of the system is determined by comparing the initial resistance value to that observed after a given test exposure. The difference is the change in resistance occurring whose magnitude establishes the stability of the interface being evaluated.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 23.
2. Test Conditions:
 - a) Test Current : 10 milliamps maximum
 - b) Open Circuit Voltage : 20 millivolts
 - c) No. of Positions Tested : 24 per test sample

-continued on next page.

REQUIREMENTS:

Low level circuit resistance shall be measured and recorded.

RESULTS:

1. The following is a summary of the data observed:

LOW LEVEL CIRCUIT RESISTANCE
(Milliohms)

<u>Sample ID#</u>	<u>Avg.</u>	<u>Max.</u>	<u>Min.</u>
B-A-1	21.5	22.5	20.5

DURABILITY

PURPOSE:

1. This is a conditioning sequence which is used to induce the type of wear on the contacting surfaces which may occur under normal service conditions. The connectors are mated and unmated a predetermined number of cycles. Upon completion, the units being evaluated are exposed to the environments as specified to assess any impact on electrical stability resulting from wear or other wear dependent phenomenon.
2. This type of conditioning sequence is also used to mechanically stress the connector system as would normally occur in actual service. This sequence in conjunction with other tests is used to determine if a significant loss of contact pressure occurs from said stresses which in turn, may result in an unstable electrical condition to exist.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 09.
2. Test Conditions:
 - a) No. of Cycles : 100
 - b) Rate : 1.0 inch per minute
3. The mating part (small board) was assembled to special holding devices; the part (large board) was attached to an X-Y table. Speed is approximate.

-continued on next page.

PROCEDURE:-continued

4. The test samples were axially aligned to accomplish the mating and unmating function allowing for self-centering movement.
5. Care was taken to prevent the mating faces of the test samples from contacting each other.
6. All subsequent variable testing was performed in accordance with the procedures previously indicated.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples so tested.
2. The change in low level circuit resistance shall not exceed +10.0 milliohms.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. The following is a summary of the data observed:

CHANGE IN
LOW LEVEL CIRCUIT RESISTANCE

ROOM AMBIENT: 22°C RELATIVE HUMIDITY: 48%

EQUIPMENT ID#: 27, 614, 1315, 1549, 1550

HUMIDITY (THERMAL CYCLING)

PURPOSE:

To evaluate the impact on electrical stability of the contact system when exposed to any environment which may generate thermal/moisture type failure mechanisms such as:

- a) Fretting corrosion due to wear resulting from micromotion, induced by thermal cycling. Humidity accelerates the oxidation process.
- b) Oxidation of wear debris or from particulates from the surrounding atmosphere which may have become entrapped between the contacting surfaces.
- c) Failure mechanisms resulting from a wet oxidation process.

PROCEDURE:

1. The test environment was performed in accordance with EIA 364, Test Procedure 31, Test Condition B, Method III (omitting steps 7a and 7b) with the following conditions.

2. Test Conditions:

- a) Preconditioning (24 hours) : 50°C ± 5°C
- b) Relative Humidity : 90% to 98%
- c) Temperature Conditions : 25°C to 65°C
- d) Cold Cycle : No
- e) Polarizing Voltage : No
- f) Mating Conditions : Mated
- g) Mounting Conditions : Mounted
- h) Duration : 240 hours

-continued on next page.

PROCEDURE:-continued

3. Prior to performing variable measurements, the test samples were allowed to recover to room ambient conditions.
4. All subsequent variable testing was performed in accordance with the procedures previously indicated.

REQUIREMENTS:

1. There shall be no evidence of physical deterioration of the test samples as tested.
2. The change in low level circuit resistance shall not exceed +10.0 milliohms.

RESULTS:

1. The test samples as tested showed no evidence of physical deterioration.
2. The following is a summary of the data observed:

CHANGE IN
LOW LEVEL CIRCUIT RESISTANCE
(Milliohms)

<u>Sample ID#</u>	<u>Avg. Change</u>	<u>Max. Change</u>
B-A-1	-0.8	+0.4
B-A-2	-1.4	-0.6
B-A-3	-2.9	-1.2
B-A-4	-0.7	+0.3
B-A-5	-0.6	+0.7
B-A-6	-0.7	+0.3
B-A-7	-1.0	-0.2
B-A-8	-1.4	-0.3

3. See data files 20942201 through 20942208 for individual data points.

TEST RESULTS

SEQUENCE C

Group A

PROJECT NO.: 209422

SPECIFICATION: TC0929-2611

PART NO.: LSHM-150-06.0-L-
DV-A-N

PART DESCRIPTION: LSHM series
connector

SAMPLE SIZE: 8 Samples

TECHNICIAN: GL

START DATE: 8/13/09

COMPLETE DATE: 8/13/09

ROOM AMBIENT: 21°C

RELATIVE HUMIDITY: 48%

EQUIPMENT ID#: 207, 1047, 1276, 1555, 1564

LOW LEVEL CIRCUIT RESISTANCE (LLCR)

PURPOSE:

1. To evaluate contact resistance characteristics of the contact systems under conditions where applied voltages and currents do not alter the physical contact interface and will detect oxides and films which degrade electrical stability. It is also sensitive to and may detect the presence of fretting corrosion induced by mechanical or thermal environments as well as any significant loss of contact pressure.
2. This attribute was monitored after each preconditioning and/or test exposure in order to determine said stability of the contact systems as they progress through the applicable test sequences.
3. The electrical stability of the system is determined by comparing the initial resistance value to that observed after a given test exposure. The difference is the change in resistance occurring whose magnitude establishes the stability of the interface being evaluated.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 23.

-continued on next page.

PROCEDURE:-continued

2. Test Conditions:

- a) Test Current : 10 milliamps
- b) Open Circuit Voltage : 20 millivolts
- c) No. of positions tested : 24 per sample

REQUIREMENTS:

Low level circuit resistance shall be measured and recorded.

RESULTS:

1. The following is a summary of the data observed:

LOW LEVEL CIRCUIT RESISTANCE
(Milliohms)

<u>Sample ID#</u>	<u>Avg.</u>	<u>Max.</u>	<u>Min.</u>
C-A-1	22.3	23.8	21.0
C-A-2	22.3	25.4	20.2
C-A-3	21.9	23.9	19.8
C-A-4	22.0	25.8	19.7
C-A-5	21.7	23.6	19.9
C-A-6	21.4	23.2	17.6
C-A-7	23.5	29.3	21.1
C-A-8	21.5	22.4	20.5

2. See data files 20942209 through 20942216 for individual data points.

PROJECT NO.: 209422 SPECIFICATION: TC0929-2611

PART NO.: LSHM-150-06.0-L- PART DESCRIPTION: LSHM series
DV-A-N connector

SAMPLE SIZE: 8 Samples TECHNICIAN: MHB

START DATE: 8/17/09 COMPLETE DATE: 8/17/09

ROOM AMBIENT: 22°C RELATIVE HUMIDITY: 48%

EQUIPMENT ID#: 553, 1166, 1167, 1168, 1271, 1272, 1533, 1556

MECHANICAL SHOCK (SPECIFIED PULSE)

PURPOSE:

To determine the mechanical and electrical integrity of connectors for use with electronic equipment subjected to shocks such as those expected from handling, transportation, etc.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 27, Test Condition C.
2. Test Conditions:
 - a) Peak Value : 100 G
 - b) Duration : 6 Milliseconds
 - c) Wave Form : Half-Sine
 - d) Velocity : 12.3 feet per second
 - e) No. of Shocks : 3 Shocks/Direction, 3 Axes (18 Total)
3. A stabilizing medium was used such that the mated test samples did not separate during testing.
4. Figure #2 illustrates the test sample fixturing utilized during the test.
5. All subsequent variable testing was performed in accordance with the procedures previously indicated.

REQUIREMENTS: See Next Page.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples as tested.
2. The change in low level circuit resistance shall not exceed +10.0 milliohms.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. The following is a summary of the data observed:

CHANGE IN
LOW LEVEL CIRCUIT RESISTANCE
(Milliohms)

<u>Sample ID#</u>	<u>Avg. Change</u>	<u>Max. Change</u>
C-A-1	-0.0	+0.0
C-A-2	-0.1	+0.4
C-A-3	-0.3	+0.0
C-A-4	-0.2	+0.0
C-A-5	-0.2	+0.2
C-A-6	-0.2	+0.1
C-A-7	-0.2	+0.1
C-A-8	+0.0	+1.3

3. See data files 20942209 through 20942216 for individual data points.
4. The Mechanical Shock characteristics are shown in Figures #3 (Calibration Pulse) and #4 (Test Pulse). Each figure displays the shock pulse contained within the upper and lower limits as defined by the appropriate test specification.

VIBRATION, RANDOM

PURPOSE:

1. To establish the mechanical integrity of the test samples exposed to external mechanical stresses.
2. To determine if the contact system is susceptible to fretting corrosion.
3. To determine if the electrical stability of the system has degraded when exposed to a vibratory environment.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 28, Test Condition V, Letter B.
2. Test Conditions:
 - a) Power Spectral Density : 0.04 g²/Hz
 - b) G 'rms' : 7.56
 - c) Frequency : 50 to 2000 Hz
 - d) Duration : 2.0 hrs per axis, 3 axes total
3. A stabilizing medium was used such that the mated test samples did not separate during the test.
4. Figure #5 illustrates the test sample fixturing utilized during the test.

-continued on next page

PROCEDURE:-continued

5. All subsequent variable testing was performed in accordance with procedures previously indicated.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples as tested.
2. The change in low level circuit resistance shall not exceed +10.0 milliohms.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. The following is a summary of the observed data:

TEST RESULTS

SEQUENCE D

Group A

PROJECT NO.: 209422	SPECIFICATION: TC0929-2611

PART NO.: LSHM-150-06.0-L- DV-A-N	PART DESCRIPTION: LSHM series connector

SAMPLE SIZE: 3 Samples	TECHNICIAN: GL

START DATE: 8/17/09	COMPLETE DATE: 8/17/09

ROOM AMBIENT: 22°C	RELATIVE HUMIDITY: 48%

EQUIPMENT ID#: 553, 1028, 1147, 1166, 1167, 1168, 1271, 1272, 1533, 1556, 5045R	

MECHANICAL SHOCK (SPECIFIED PULSE)

PURPOSE:

To determine the mechanical and electrical integrity of connectors for use with electronic equipment subjected to shocks such as those expected from handling, transportation, etc.

PROCEDURE:

1. The test was performed in accordance with EIA 364, Test Procedure 27, Test Condition C.
2. Test Conditions:
 - a) Peak Value : 100 G
 - b) Duration : 6 Milliseconds
 - c) Wave Form : Half-Sine
 - d) Velocity : 12.3 feet Per Second
 - e) No. of Shocks : 3 Shocks/Direction, 3 Axes (18 Total)
3. A stabilizing medium was used such that the mated test samples did not separate during the test.
4. Figure #6 illustrates the test sample fixturing utilized during the test.
5. The samples were characterized to assure that the low nanosecond event being monitored will trigger the detector.

-continued on next page.

Contech Research

An Independent Test and Research Laboratory

PROCEDURE:-continued

6. The low nanosecond monitoring was performed in accordance with EIA 364, Test Procedure 87.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples as tested.
2. There shall be no low nanosecond event detected greater than 50 nanoseconds.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. There was no low nanosecond event detected greater than 50 nanoseconds.
3. The Mechanical Shock characteristics are shown in Figures #7 (Calibration Pulse) and #8 (Test Pulse). Each figure displays the shock pulse contained within the upper and lower limits as defined by the appropriate test specification.

DV-A-N connector

SAMPLE SIZE: 3 Samples TECHNICIAN: GL

START DATE: 8/20/09 COMPLETE DATE: 8/20/09

ROOM AMBIENT: 22°C RELATIVE HUMIDITY: 50%

EQUIPMENT ID#: 553, 1028, 1147, 1166, 1167, 1168, 1271, 1272,
1395, 1533, 1556, 5045R

VIBRATION, RANDOM

PURPOSE:

1. To establish the mechanical integrity of the test samples exposed to external mechanical stresses.
2. To determine if the contact system is susceptible to fretting corrosion.
3. To determine if electrical discontinuities at the level specified exist.

PROCEDURE:

1. The test was performed in accordance with Specification EIA 364, Test Procedure 28, Test Condition V, Letter B.
2. Test Conditions:
 - a) Power Spectral Density : 0.04 g²/Hz
 - b) G 'rms' : 7.56
 - c) Frequency : 50 to 2000 Hz
 - d) Duration : 2.0 hrs per axis, 3 axes total
3. A stabilizing medium was used such that the mated test samples did not separate during the test.
4. Figure #5 illustrates the test sample fixturing utilized during the test.

-continued on next page.

PROCEDURE:-continued

5. Prior to testing, the connectors were characterized to assure that the desired event being monitored was capable of being detected.
6. The low nanosecond event detection was performed in accordance with EIA 364, Test Procedure 87.

REQUIREMENTS:

1. There shall be no evidence of physical damage to the test samples as tested.
2. There shall be no low nanosecond event detected greater than 50 nanoseconds.

RESULTS:

1. There was no evidence of physical damage to the test samples as tested.
2. There was no low nanosecond event detected greater than 50 nanoseconds.
