Vivado Board Part Flow

Table of Content

Definition

TE Board Part Files

Usage

TE reference design scripts provide all necessary steps for a local board part installation and PS-Initialization. Reference Designs provide additional informations and instructions

General sescription of the reference design project delivery:

- Project Delivery #QuickStart
- Project Delivery #Initialise TE-scripts on Vivado/LabTools
- Project Delivery #Block Design Conventions

For manual Initialization use following description.

Installation

Overview

The Vivado® Design Suite allows you to create projects based on specific boards. Trenz Electronic provides Vivado Board Part files in the download area. This files are included into the reference projects, please choose a reference design under the proper module.

There are three options for installing the Board Part files

- Option1: Use Trenz Electronic Reference Design with local board part file
- Option2: Xilinx Git Hub for Vivado
- Option3: Install into a User Repository
- Option4: Install into the Vivado installation

Attention: The board part files of our reference designs are for the corresponding Vivado version of the project delivery. It's possible to use them with other Vivado versions, but maybe it's not working correctly, if this is done.

Option 1: Use Trenz Electronic Reference Design with local board part file

The board part file will be set for the local project, if the project is generated with the provided scripts from the project delivery. More information on: Project Delivery - Xilinx devices

Option 2: Xilinx Git Hub for Vivado

Coming soon for Vivado 2019.1 and newer

Option 3: Install into a User Repository

This Option allows you to install the Vivado Board Part files to any location of your choosing. The disadvantage is that it required an additional command to point the tools to your repository.

> ⚠ This description is for Vivado 2015.1 and higher. Older Vivado versions used other variable names, so some changes are necessary.
>
> Since Vivado 2017.1, "init.tcl" should be renamed to "Vivado_init.tcl"

1. Create init.tcl with following content:

```
if { [catch {
  # #############################
  # insert settings here:
  set tepath "C:/TE"
  if {[file exists ${tepath}/]} {
    set_param board.repoPaths $tepath
    puts "Set Board Part RepoPath: [get_param board.repoPaths]"
  }
  # #############################
}] } {
  puts "Info: (TE) init.tcl failed"
}
```

2. Put init.tcl in one of the possible locations for init.tcl:
   a. Vivado Project (For current version only): <*installdir*>/vivado/<version>/scripts/
   b. User Data(For all versions): C:/Users/<user>/AppData/Roaming/Xilinx/Vivado/
3. Copy the Board part files folder from the reference project (<reference_design>/board_files/) into the folder C:/TE (the folder location can be changed in the init.tcl script). The *.csv file from <reference_design>/board_files/ is not necessary for this way.

4. Start your Vivado Version and the TCL-console printout should be the following:
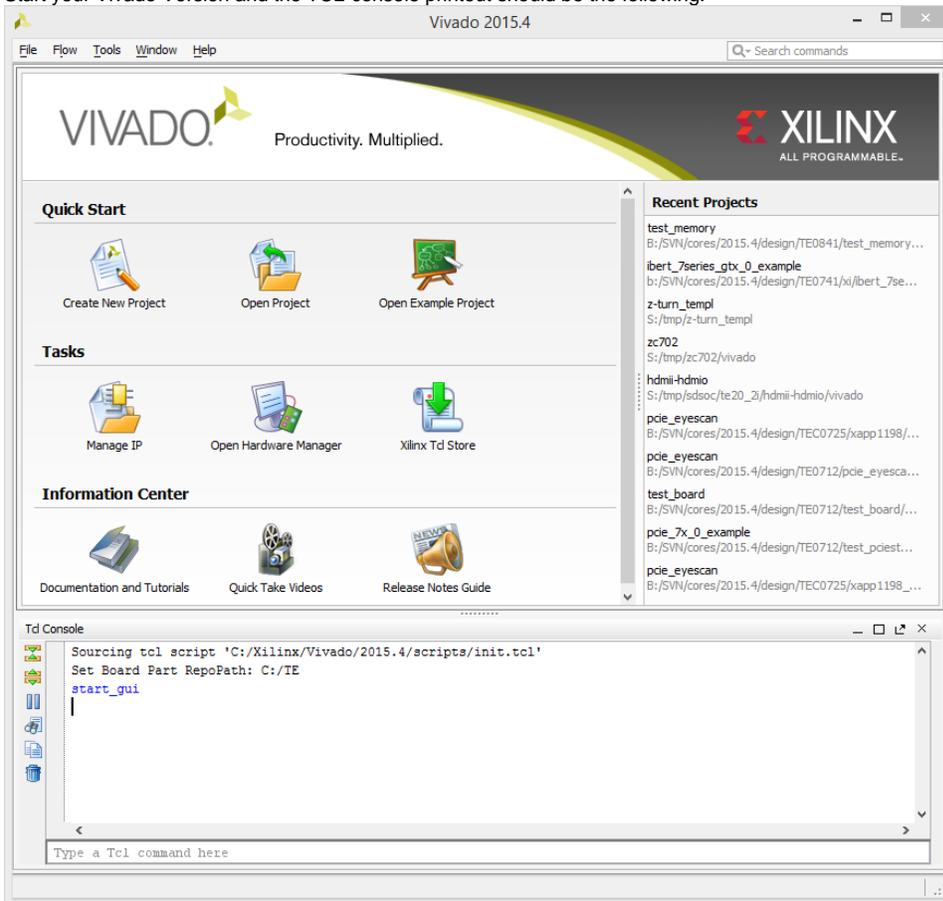

⚠ Please make sure you use plain ASCII text editor when creating the init.tcl file, any non ASCII character in the file will make Vivado to freeze on startup.

A working init.tcl file is provided in the archive with this tutorial. With this method you can set up a permanent initialization TCL that is read by Vivado each time it launches. Details about the init.tcl file are included in UG835 Vivado Design Suite Tcl Command Reference Guide. UG835 describes where to put the init.tcl file.

Option 4: Install into the Vivado installation

This is the quickest option, but it is not recommended by Xilinx. Use at your own risk.

1. Copy the Board part files folder from the reference project (<reference_design>/board_files/) into the folder <*installdir*>/vivado/<version>/data/boards/board_files/. The *.csv file from <reference_design>/board_files/ is not necessary for this way.

Load on Vivado

Regardless of which method you choose, the new boards should now be visible in Vivado 2015.1 or higher for vendor trenz.biz . To test this out, do the following.

1. Launch Vivado.
2. Select **Create New Project**.
3. Click **Next>** to get started.
4. Set the project name and location. Press **Next>**.
5. Select project type Click **Next>**.
6. At the **Default Part** screen,
   a, Click **Boards** under Specify.
   b, Click **trenz.biz** under Vendor.

The options should appear as shown.
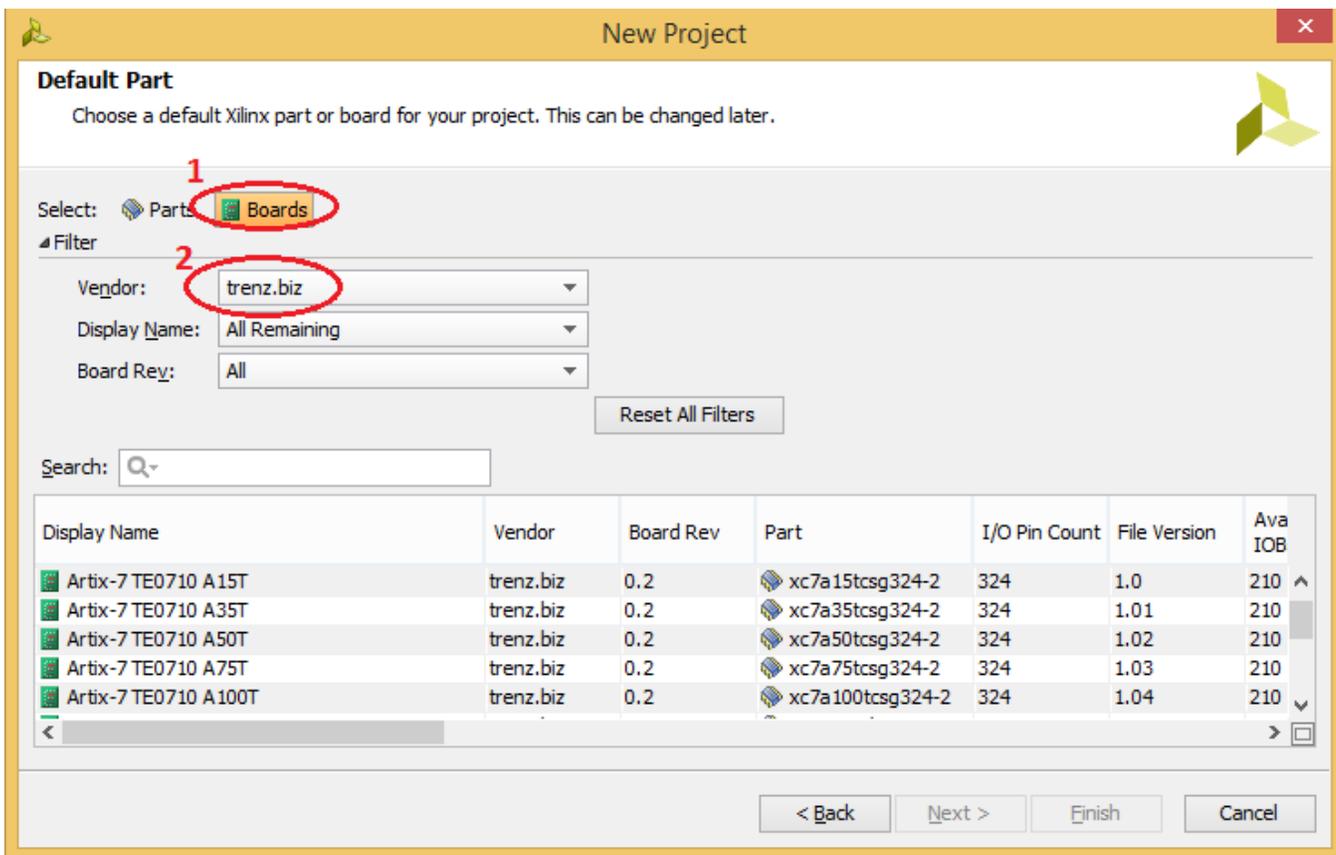

For more information about this capability, please refer to the following Quick Take video.

- http://www.xilinx.com/training/vivado/using-vivado-with-xilinx-evaluation-boards.htm

Software Requirements
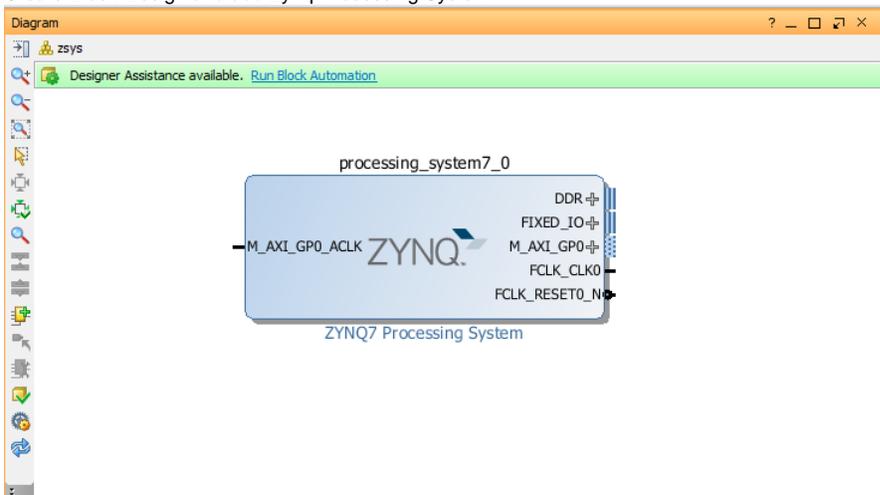

The software used is

- Xilinx Vivado 2015.4 or higher (for install option 1, 3, 4)
- Xilinx Vivado 2019.1.3 or higher (for install option 1, 2, 3, 4)
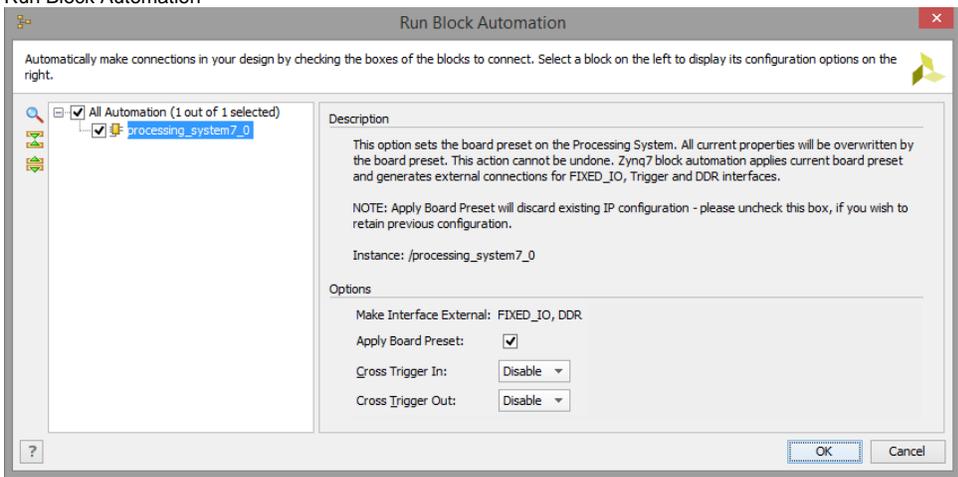

Zynq PS-Initialization (7Series/UltraScale+)

1. Install Board Parts, see: Board Part Installation
2. Create Project with Board Part
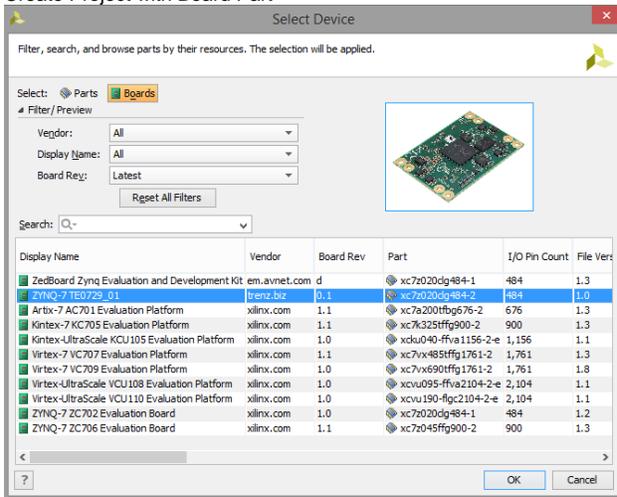

3. Create Block-Design and add Zynq-Processing System

4. Run Block Automation

5. PS configuration is finished with basic Settings:

6. (optional)Some Reference Design contains local extensions for some carrier depended configuration, located in the subfolder <board_parts>/.
   These Scripts must be source manually on the TCL-Console after "Block-Design Automation"
